

Chapter 1: Introduction

This is a sample text-based PDF document created for testing the pdf2md-compliance tool. This page contains real extractable text.

The tool converts PDF files to Markdown while maintaining compliance records including SHA-256 checksums, manifests, and conversion logs.

Key features:

- Page-by-page conversion with page markers
- Scanned PDF detection and rejection
- Full audit trail with manifest.json

Chapter 2: Methodology

The conversion process uses the @opendocsg/pdf2md library as its core PDF-to-Markdown engine, combined with pdfjs-dist for pre-filtering.

Each page is processed individually and prefixed with a standardised page marker comment in the format:

```
<!-- page: N of Total -->
```

```
## Page N
```

This ensures that every section of the output Markdown can be traced back to its exact source page in the original PDF document.

Chapter 3: Compliance Trail

For every conversion job, the tool creates a structured output folder:

`/output/{YYYY-MM-DD}/{slug}/`

`document.md` — Converted Markdown output

`manifest.json` — Full audit metadata

`conversion.log` — Structured processing log

The manifest includes SHA-256 checksums of both the input PDF and the output Markdown, along with tool versions, timestamps, and system info.

This is the final page of the sample document.
